

MIDNIGHT BUILDATHON · WAVE 2

Lixi

Private red envelopes on Midnight.

Every light is one lì xì. Only its link knows whose.

lixi-3nv.pages.dev · github.com/hms1499/lixi-midnight

Red packets on chain are public

Mask HappyRedPacket

EVM and Solana

Red Envelopes

BNB Smart Chain

IRISnet

Cosmos

Every amount, every recipient and the whole split sit on chain for anyone to read.

A real lì xì is private: only the giver and the receiver know what is inside.

Every light is one lì xì.

Only its link knows whose.

The sender seals tNIGHT into up to 16 lì xì and sends each person a link. The chain keeps a fingerprint of the split, never the split.

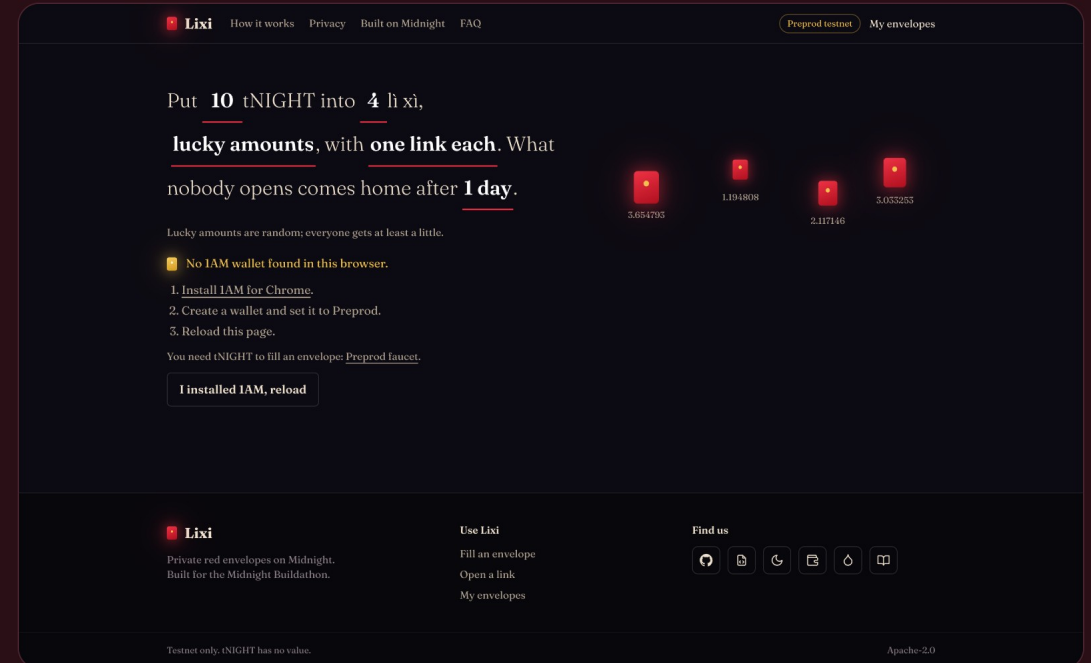

Seal, share, open, bring home

Seal. Write the envelope as a sentence; lucky or equal amounts.

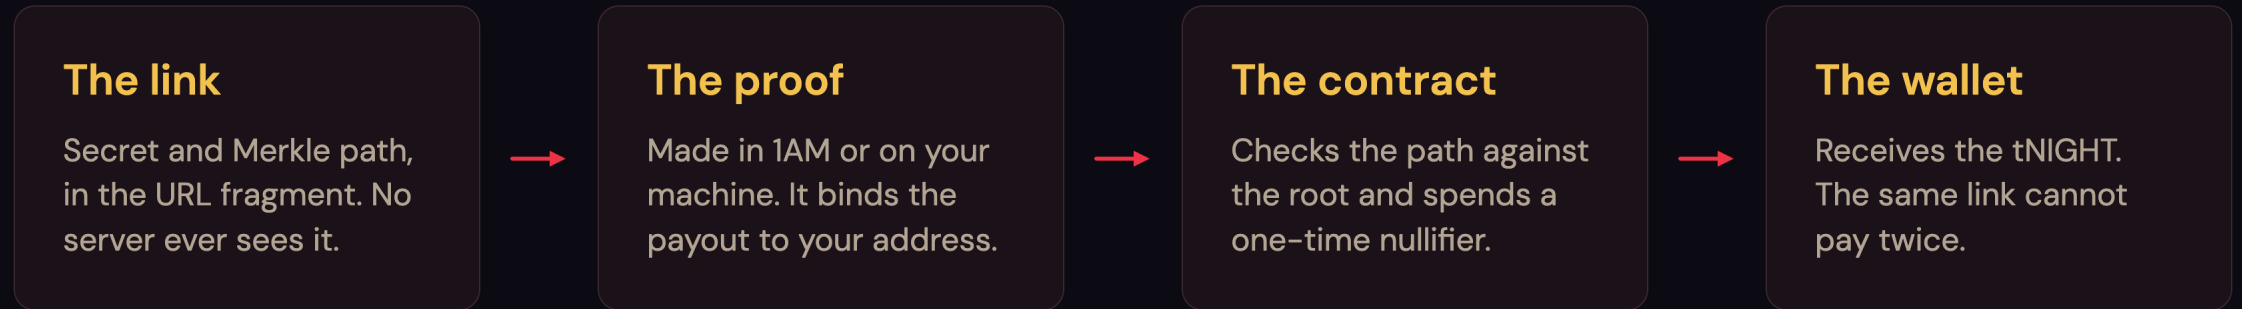

Share. One link per lì xì, or one group link.

Open. A proof claims it; tNIGHT lands in the wallet.

Bring home. After expiry, what nobody opened goes back.

How a claim stays private

The proof says "I hold a valid lì xì" without saying which one.

What the chain sees

The chain sees	It never sees
That an envelope exists, its total and its expiry	How many lì xì a personal envelope holds
Whether it uses a group link	The sizes of the lì xì nobody has opened
The sender's address	Which link paid which opening
Each opening: who received, and how much	The secrets inside the links

Payouts are unshielded tNIGHT, so each opening is public. A group link splits equally, so its first opening reveals the count.

Built on Midnight

One Compact contract

createEnvelope, claim and refund. Per envelope it stores a Merkle root, the deposit, the expiry, the refund address and the group flag; never the split.

Dual ledger

The share and its path are private witnesses; the root and spent nullifiers are public state; the payout is unshielded tNIGHT.

Proving in the wallet or locally

Proofs are made in 1AM by default, or by a proof server on your own machine. Lixi never sends one to a shared server.

No admin key

The maintenance authority is given up at deploy, so nobody can change the contract.

Tested end to end

209

tests in four suites; the contract, SDK and app tests run against the real compiled contract.

Suite	Tests	Covers
contract	32	circuits, forged paths
sdk	44	splits, links, vault
cli	19	config, redaction
app	114	every page, CSP

CI on every push · devnet end-to-end: deploy, concurrent claims, refund · a design audit with its fixes

Who it is for

Tết lucky money

Weddings

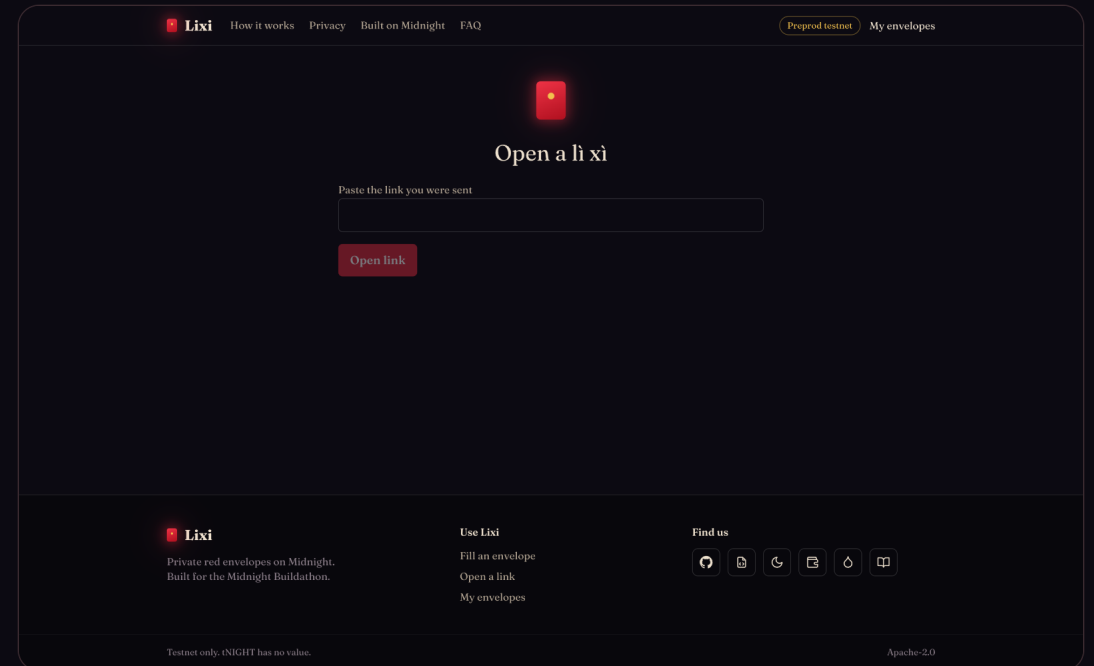

Birthdays

Team bonuses

Community giveaways

Personal links for family; one group link, one lì xì per wallet, for a crowd. Recipients see what is inside before they connect.

No red-envelope entry among the ~161 Wave 1 submissions.

Wave 3

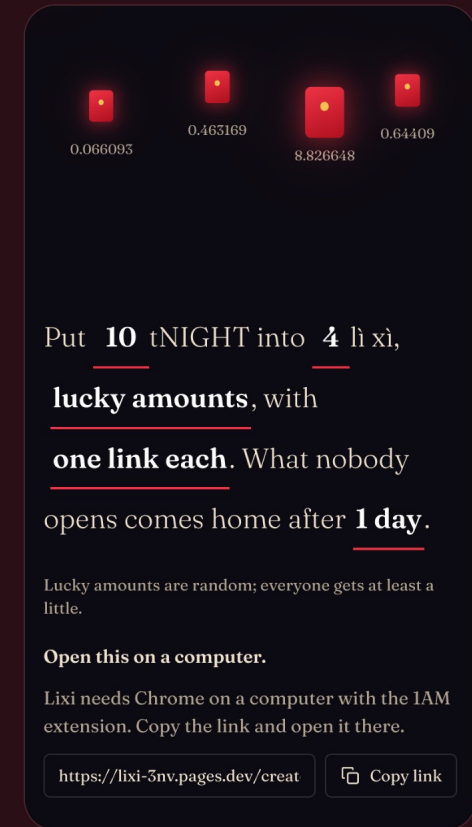

Mobile. Open lì xì from the 1AM mobile app.

Fees for any wallet. A sponsor, so recipients need no DUST.

Shielded payouts. Hide each opening too.

Bigger envelopes. More than 16 lì xì.

QR codes. For giving lì xì in person.

Today a phone hands the link to a computer.

Open a lì xì

Where	Link
Live site	lixi-3nv.pages.dev
Code	github.com/hms1499/lixi-midnight
Contract	Preprod · deployments/preprod.json
Video	[video link, added by the team]

Chrome on a computer with the 1AM wallet, set to Preprod. 1AM pays the fee.
